M0
E01
Binary authenticity vs masking
Static expected reward
$\Delta_0(p) = a + c - (1-p)(b+r)$
static M0 objective boundary $p^* = 43/60$
add graded action space
M1
E02
Graded disclosure
Affine objective
$E[R(d)] = b - c + d\,[a + c - (1-p)(b+r)]$
affine in d: strict optimum at an endpoint
add persistent social state
M2
E03
Actions change future state
Dynamic Bellman optimum
$D_N(V) = \Delta_0(p) + \gamma\,[\,pV_A + (1-p)V_S - V_N\,]$
full-information dynamic comparator
add heterogeneous receptive contexts
M3
E04, E05
Heterogeneous contexts
Discovery, scarcity, comparison cost
$\max\{R_M, R_G, R_B\}$ invariant in K (one good context)
objective comparison-cost crossover $b_f^* = 8/17$
