A
Underidentification architecture
Different upstream conditions can converge on similar observed concealment
Learning history
Current social conditions
Action representation
Persistent social consequences
Contextual availability and discoverability
Learner information and expectations
Similar current conditions can yield different behaviour when learning histories and expectations differ
Observed ability visibility / concealment
B
Experimental mechanism map
Five experimental routes to the same observed behavioural endpoint
E01 Restricted sampling
E02 Action representation
Experimental decomposition
E03 Persistent state and dynamic value
E04 Contextual discoverability
E05 Learned–environmental boundary
